

VeriBuy

AI Product Verification Platform — Master Prompt

Purpose: A premium, Apple-inspired product verification platform that helps users evaluate online products, sellers, reviews, prices, and authenticity before purchasing.

Important implementation rule: If real marketplace/API integrations are unavailable, every simulated result must be clearly labeled as a demo/simulation. Never present fabricated checks as real verification.

1. Project Overview

Build a premium, Apple-inspired, single-page web application called **VeriBuy**.

The user pastes a product URL from an e-commerce platform such as Amazon, Flipkart, Meesho, Myntra, Ajo, eBay, or Walmart.

The AI Verification Engine should determine whether the URL is actually product-related, analyze available product evidence, evaluate seller and review trust, compare prices where reliable matching data exists, estimate authenticity/counterfeit risk, and generate a complete, easy-to-understand report.

Make the experience feel like a real-time startup product: polished, responsive, fast, trustworthy, and impressive.

2. Core User Flow

1. User opens VeriBuy.
2. User pastes a product URL.
3. System validates whether the URL points to a product/listing.
4. System identifies the marketplace.
5. System extracts or receives available product data.
6. AI analyzes product, seller, reviews, specifications, pricing, and risk indicators.
7. System compares matching products across supported marketplaces when reliable data is available.
8. Verification console shows live-looking progress based only on actual completed processing.
9. Dashboard presents scores, evidence, charts, price comparison, risks, and recommendation.
10. Final result clearly distinguishes verified evidence from estimates or simulated/demo data.

3. Apple-Inspired Design Language

Use large white space, minimal layouts, glassmorphism with subtle blur, 16–20px rounded corners, thin borders, smooth animations, SF Pro/System fonts, soft shadows, and a professional dashboard aesthetic.

Support beautiful Light and Dark modes.

Primary palette: White, Off-white, Light Gray, Black, Space Gray, Apple Blue (#0071E3).

Animations should feel smooth and elegant rather than excessive. The interface should communicate trust and premium quality.

4. Navigation

Include: VeriBuy Logo, Home, Features, How It Works, About, Theme Toggle.

Navigation should remain sticky and use backdrop blur.

5. Hero Section

Large title: **Verify Before You Buy.**

Subtitle: **AI analyzes products, reviews, sellers, pricing, and authenticity to help you make smarter purchasing decisions.**

Include a large URL input with placeholder: **Paste an Amazon, Flipkart, Myntra, Meesho or any product link...**

Include a prominent **Analyze Product** button.

6. URL & Product Validation

The system must first check whether the pasted URL is syntactically valid and whether it appears to reference a product/listing page.

If it is not product-related, show a clear message instead of generating a fake report.

Identify the marketplace/domain when supported.

If extraction is unavailable, explain the limitation and use clearly marked demo data only if the user explicitly proceeds with simulation/demo mode.

7. AI Verification Console

After Analyze Product, open a polished animated terminal/console window.

Show each step progressively with typing animation, green completion indicators, and a progress bar.

8. Verification Console Steps

- Initializing VeriBuy AI...
- URL detected
- Marketplace identified
- Validating product page
- Extracting Product Information
- Loading Product Metadata
- Comparing Product Across Marketplaces
- Running Historical Price Analysis
- Checking Seller Reputation
- Detecting Fake Reviews
- Review Sentiment Analysis
- Review Pattern Analysis
- Detecting Spam Reviews
- Detecting AI-generated Reviews

- Comparing Product Specifications
- Looking for Duplicate Listings
- Counterfeit Risk Analysis
- Authenticity Score Calculation
- Recommendation Generated
- Verification Complete

9. Product Authenticity

Estimate or calculate, using available evidence: Genuine Product Probability, Fake Product Probability, Counterfeit Risk, Brand Match, Product Specification Match, and Duplicate Listing Detection.

Display an Authenticity Score such as 94% only when the underlying evidence/calculation supports it.

Example badge: **Likely Genuine**.

10. Seller Analysis

Analyze Seller Rating, Seller History, Seller Reputation, Marketplace Trust, Fulfillment Type, Return Policy, and Warranty Availability.

Output a Seller Trust Score.

11. Review Verification

Analyze reviews for fake-review indicators, bot-generated patterns, repeated reviews, spam, rating manipulation, timing anomalies, suspicious review bursts, language similarity, review authenticity, and sentiment distribution.

Output Review Trust Score and Fake Review Risk: Low / Medium / High.

Do not claim that an individual review is definitively fake unless there is strong verifiable evidence; present suspicious-pattern findings as indicators.

12. Price Analysis

Show Current Price, Average Market Price, Lowest Available Price, Highest Price, Discount Accuracy, Historical Pricing, Price Trend, and Price Prediction where data supports them.

Use an interactive line chart.

Example insights: “This product is currently 12% cheaper on another marketplace.” or “This is the best available price.”

Only make cross-marketplace claims when matching product identity and price data are sufficiently reliable.

13. Cross-Platform Price Comparison

Supported examples: Amazon, Flipkart, Meesho, Myntra, Ajio, eBay, Walmart.

Display: Marketplace, Price, Seller Rating, Delivery, Product Match, Buy Link.

Highlight the lowest verified price.

Clearly indicate when a marketplace could not be checked.

14. Product Specifications

Compare Model Number, Brand, RAM, Storage, Color, Size, Dimensions, Features, and other specifications.
Flag missing, conflicting, or inconsistent specifications.

15. Risk Analysis

Display Counterfeit Risk, Seller Risk, Price Manipulation Risk, Fake Review Risk, and Overall Purchase Risk.
Use Low / Medium / High badges with accessible visual indicators.

16. Final Recommendation

Generate one of: ■ **Safe to Buy**, ■ **Buy with Caution**, or ■ **High Risk Purchase**.

Provide a detailed AI explanation based on the evidence actually available.

Example explanation: "Based on seller credibility, review quality, price comparison, and product consistency, this product appears genuine with a low counterfeit risk. Reviews show natural language diversity and pricing aligns with historical trends."

Add a visible disclaimer that an AI risk assessment is not a guarantee of authenticity.

17. Dashboard Cards

Create polished cards for Product Overview, Product Image, Product Name, Brand, Marketplace, Seller, Current Price, Rating, Authenticity Score, Review Trust, Seller Trust, Price Score, Counterfeit Risk, and Recommendation.

18. Charts

Create animated charts for Price History, Review Sentiment, Rating Distribution, Authenticity Score, Risk Analysis, and Comparison Graph.

Use modern SVG or Canvas charts, preferably Chart.js where appropriate.

19. Micro Interactions

Smooth hover effects, subtle card lift, soft button glow, natural terminal typing, count-up metrics, animated charts, smooth progress bar, and dashboard fade-in.

Keep motion purposeful and accessible; respect reduced-motion preferences.

20. Responsive Design

Support Desktop, Laptop, Tablet, and Mobile.

Use fluid layouts, responsive typography, accessible touch targets, and responsive charts.

21. Recommended Technologies

Frontend: HTML5, CSS3, JavaScript (ES6 Modules).

Suggested libraries: Chart.js, GSAP, Lucide Icons.

Optional backend: Node.js + Express or Python + FastAPI.

Optional AI: OpenAI API or another LLM for summaries; review-analysis models; price-comparison APIs; marketplace APIs; historical-pricing APIs.

22. Code & Architecture Requirements

Use modular architecture, clean folder structure, reusable components, well-commented code, lazy loading where appropriate, smooth performance, accessibility support, and SEO-friendly markup.

Separate UI, validation, data extraction, analysis, scoring, and report-generation logic so the system can later be connected to real APIs.

23. Real-Time Startup-Quality Requirement

The finished website must look and behave like a credible real-world startup product, not a basic student demo.

Use realistic loading states, meaningful empty/error states, polished transitions, trustworthy wording, consistent spacing, strong visual hierarchy, and clear evidence labels.

Never fake a successful real-time API call. If a check is simulated, label it as **Demo / Simulated Analysis**.

24. Complete Product Report

After analysis, show a unified report containing product identity, marketplace, seller information, authenticity score, review trust score, seller trust score, price intelligence, cross-platform comparison, specification consistency, risk indicators, charts, evidence/limitations, and final recommendation.

Allow the user to understand *why* the recommendation was produced rather than showing only a single score.

25. Chat Reference

Reference chat provided by the user for additional project context:

Claude shared chat: <https://claude.ai/share/666afdd5-aeb6-415a-8a5f-a6d154b40b9a>

Use this reference as project context if accessible, but do not assume that its contents are available unless they are actually retrieved.

26. Final Master Requirement

Build VeriBuy as a premium Apple-inspired AI product-verification platform where a user can paste a product link and receive a professional, transparent report.

The application should validate the link first, identify the marketplace, analyze product and seller evidence, assess review authenticity indicators, compare matching prices when possible, evaluate authenticity/counterfeit risk, and generate a clear recommendation.

The output must be impressive, responsive, functional, visually polished, and transparent about the difference between real verification and simulated/demo analysis.
